# Instagram Content Strategy for Alfido Tech

Data Science Internship · Task 3 | Dataset-based engagement analysis

## 1. Project objective

Analyze the provided Instagram dataset—users, photos, likes, comments, hashtags and follow relationships—to identify observed engagement patterns and translate them into practical content tests for Alfido Tech.

## 2. Key findings

| 34.17 | 29.14 | 63.31 |
|---|---|---|
| Average likes / photo | Average comments / photo | Average total engagement / photo |

| | | | |
|---|---|---|---|
| **Best observed day** | Thursday | **Best observed hour** | 08:00 (8 AM) |
| **Best observed photo type** | Photo | **Highest average-engagement hashtag in sample** | #delicious |

## 3. Practical weekly content calendar

Thursday at 08:00 is the priority test based on the observed result. All other times below are suggestions to test—not proven best times.

| Day | Content idea | Suggested posting time |
|---|---|---|
| Monday | Quick tech tip: one useful shortcut or tool | 12:30 PM — test |
| Tuesday | Short tutorial: explain one tech concept | 6:30 PM — test |
| Wednesday | Poll: ask followers which topic to cover next | 1:00 PM — test |
| Thursday | Project showcase or behind-the-scenes post | **8:00 AM — priority test** |
| Friday | Carousel: common tech mistake and its fix | 5:30 PM — test |
| Saturday | Mini tutorial, demo, or student project highlight | 11:00 AM — test |
| Sunday | Audience question: invite tips, questions, or ideas | 7:00 PM — test |

## 4. Five actionable engagement strategies

**1. Lead with value:** publish concise, practical tech tips and tutorials that solve one clear problem.

**2. Make visuals easy to scan:** use readable covers, short captions and a clear takeaway in each photo or carousel.

**3. Invite participation:** use polls, specific audience questions and prompts that are easy to answer.

**4. Test and compare:** trial Thursday at 08:00 first; test other time slots and content formats consistently, changing one variable at a time.

**5. Review meaningful signals:** track likes and comments per post, compare like-for-like formats, and refine topics from repeated patterns.

## 5. Conclusion and limitations

The sample points to Thursday at 08:00 and photo posts as useful starting points for testing. Average engagement was 63.31 interactions per photo (likes + comments). These are dataset observations, not guaranteed Alfido Tech outcomes. The data does not provide a reliable historical follower-count series, so follower growth cannot be established. The #delicious result reflects this sample only and is not a recommendation for a technology brand; choose relevant tech hashtags and test them.
